Markus Bläser, Gorav Jindal and Anurag Pandey Deterministic PTAS for Commutative Rank

#### 1 Introduction

- Basic Problem
- Motivation
- Previous work

#### (2) Main algorithm

- A simple  $\frac{1}{2}$ -approximation algorithm
- Ideas for better approximation

#### COMPUTATIONAL COMPLE NEERENCE Image: A Image: A

< A

Basic Problem Motivation Previous work

### Setup

- $\mathbb{F}$  be any field,  $n \in \mathbb{Z}_{>0}$ .
  - $\mathbb{F}^{n \times n}$  is the (vector) space of all  $n \times n$  matrices with entries in  $\mathbb{F}$ .
- For vector spaces V, W
  - Use notation  $V \leq W$  to denote that V is a subspace of W.

#### Definition (Matrix space)

A vector space  $\mathcal{B} \leq \mathbb{F}^{n imes n}$  is called a matrix space.

Basic Problem Motivation Previous work

### Problem

#### Problem

Given a matrix space  $\mathcal{B} \leq \mathbb{F}^{n \times n}$  as input, compute its "rank".  $\mathcal{B}$  is given as input by its set of generators, i.e.  $\mathcal{B} = \langle B_1, B_2, \dots, B_m \rangle$ .

- Two notions of rank.
  - Commutative rank.
  - Non-commutative rank.

### Commutative rank

#### Definition (Commutative rank)

 $\mathcal{B} \leq \mathbb{F}^{n \times n}$  any matrix space, then Commutaive rank of  $\mathcal{B} = \operatorname{rank}(\mathcal{B}) = \max\{\operatorname{rank}(\mathcal{B}) \mid \mathcal{B} \in \mathcal{B}\}.$ 

•  $\mathcal{B} \leq \mathbb{F}^{n \times n}$  is called **full-rank** if  $\operatorname{rank}(\mathcal{B}) = n$ .

Basic Problem Motivation Previous work

### Commutative rank

#### Definition (Commutative rank)

 $\mathcal{B} \leq \mathbb{F}^{n \times n}$  any matrix space, then Commutaive rank of  $\mathcal{B} = \operatorname{rank}(\mathcal{B}) = \max\{\operatorname{rank}(B) \mid B \in \mathcal{B}\}.$ 

•  $\mathcal{B} \leq \mathbb{F}^{n \times n}$  is called full-rank if  $\operatorname{rank}(\mathcal{B}) = n$ .

COMPUTATIONAL COMPLEXITY CONFERENCE

### A different Formulation

- Matrix space  $\mathcal{B} = \langle B_1, B_2, \dots, B_m \rangle \leq \mathbb{F}^{n imes n}$ , consider the matrix
  - $B = x_1B_1 + x_2B_2 + \ldots + x_mB_m$  over the field  $\mathbb{F}(x_1, x_2, \ldots, x_m)$  of rational functions.

#### Fact

#### If $|\mathbf{F}| > n$ then $\operatorname{rank}(\mathcal{B}) = \operatorname{rank}(\mathcal{B})$ .

- Gives a randomized polynomial time algorithm using Schwartz–Zippel lemma.
  - Even an RNC algorithm.

### Our contribution

#### • A deterministic PTAS for computing the Commutative rank.

#### Theorem

For any Matrix space  $\mathcal{B} \leq \mathbb{F}^{n \times n}$  as input, a deterministic poly-time algorithm which outputs a matrix  $A \in \mathcal{B}$  such that

$$\operatorname{rank}(A) \ge (1 - \epsilon) \operatorname{rank}(\mathcal{B}).$$

Algorithm runs in time  $n^{O(\frac{1}{\epsilon})}$ .

### Why study this problem?

- Generalizes several computational problems from algebra and combinatorics.
  - Bipartite matching
  - Linear Matroid intersection.
  - Maximum matching
  - Linear matroid parity problem
- Polynomial identity testing(PIT) of Algebraic branching programs(ABP)

Basic Problem Motivation Previous work

### Special cases

#### ullet NP-complete when the field ${\mathbb F}$ is of constant size.

- Deterministic polynomial time algorithms when B<sub>i</sub>'s all are of rank 1.
  - Subsumes bipartite maximum matching, linear matroid intersection.
  - Even a quasi-NC algorithm by [Gurjar and Thierauf, 2016].

### Algorithms for Non-commutative rank

- Gurvits, 2004 : Deterministic poly-time algorithms for "compression spaces"
  - Matrix space  $\mathcal{B}$  is a compression space if  $rank(\mathcal{B}) = ncr(\mathcal{B})$ .

#### Theorem (GGOW 2015, Ivanyos et al.,2015 )

There is a deterministic poly-time algorithm which computes the  $\operatorname{ncr}(\mathcal{B})$  for any matrix space  $\mathcal{B} \leq \mathbb{F}^{n \times n}$ .

COMPUTATIONAL COMPLEXITY CONFER

### Algorithms for Non-commutative rank

- Gurvits, 2004 : Deterministic poly-time algorithms for "compression spaces"
  - Matrix space  $\mathcal{B}$  is a compression space if  $rank(\mathcal{B}) = ncr(\mathcal{B})$ .

#### Theorem (GGOW 2015, lvanyos et al., 2015)

There is a deterministic poly-time algorithm which computes the  $\operatorname{ncr}(\mathcal{B})$  for any matrix space  $\mathcal{B} \leq \mathbb{F}^{n \times n}$ .

COMPUTATIONAL COMPLEXIA

### Approximation algorithms for Commutative rank

- Using rank(B) ≤ ncr(B) ≤ 2 · rank(B), one gets a deterministic poly-time algorithms for ½-approximation of Commutative rank.
- These Non-commutative rank computation algorithms were the only algorithms which compute any constant factor approximation of the commutative rank.

COMPUTATIONAL COMPLEXIA

### Approximation algorithms for Commutative rank

- Leads to a natural question whether this approximation ratio of  $\frac{1}{2}$  can be improved?
- We devise a deterministic poly-time algorithm which improves this approximation ratio to  $1-\epsilon$  for arbitrary constant  $0<\epsilon<1.$

### Main Idea

• 
$$\mathcal{B} = \langle B_1, B_2, \dots, B_m \rangle \leq \mathbb{F}^{n \times n}$$
  
•  $B = x_1 B_1 + x_2 B_2 + \dots + x_m B_m$  over the field  
 $\mathbb{F}(x_1, x_2, \dots, x_m)$ 

- We have some  $A \in \mathcal{B}$  with some rank r.
  - Want to find  $A' \in \mathcal{B}$  with  $\operatorname{rank}(A') > r$ .

### Main Idea

• 
$$\mathcal{B} = \langle B_1, B_2, \dots, B_m \rangle \leq \mathbb{F}^{n \times n}$$
.  
•  $B = x_1 B_1 + x_2 B_2 + \dots + x_m B_m$  over the field  
 $\mathbb{F}(x_1, x_2, \dots, x_m)$ .

- We have some  $A \in \mathcal{B}$  with some rank r.
  - Want to find  $A' \in \mathcal{B}$  with  $\operatorname{rank}(A') > r$ .

• WLOG assume 
$$A = \begin{bmatrix} I_r & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & 0 & 0 \end{bmatrix}$$
.  
• Consider the matrix  $A + B \in \mathbb{F}(x_1, x_2, \dots, x_m)^{n \times n}$ 

# Main idea(Cont.)

• 
$$A + B = \begin{bmatrix} I_r + B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix}$$
.

- Suppose B<sub>22</sub> = 0 then rank(A + B) = rank(B) ≤ 2r.
  rank(A) is already <sup>1</sup>/<sub>2</sub>-approximation of rank(B).
- Otherwise  $B_{22} \neq 0$ ,  $c(x_1, x_2, \dots, x_m)$  be a non-zero entry of  $B_{22}$ .

Markus Bläser, Gorav Jindal and Anurag Pandey Deterministic PTAS for Commutative Rank

э

### Final Step

- If we can find a setting of  $x = \lambda_1, x_2 = \lambda_2, \ldots, x_m = \lambda_m$  such that  $\det(M(\lambda_1, \lambda_2, \ldots, \lambda_m)) \neq 0$ .
  - Then we get a rank r+1 matrix in  $\mathcal{B}$ .
  - det $(M(x_1, x_2, \ldots, x_m))$  has degree 1 monomials.

#### Fact

If a non-zero polynomial  $f(x_1, x_2, ..., x_m)$  has a degree k monomial and deg $(f) \le n$ , then one can find a non-zero assignment  $x_1 = \lambda_1, x_2 = \lambda_2, ..., x_m = \lambda_m$  for f, by trying  $O((mn)^k)$  choices.

- Gives a "rank increasing assignment of x<sub>i</sub>'s" by trying O(mn) choices.
- Gives a matrix of bigger rank in B

### Degree 3 terms

• We saw that if degree one and degree two terms for all choices of *M* are zero then

• 
$$B_{21}B_{12} = 0$$

• 
$$B_{22} = 0$$

• What if degree three terms are also zero?

### Lemma

If degree 1,2 and 3 terms are all zero in det(M) for all M then  $B_{22} = 0$ ,  $B_{21}B_{12} = 0$  and  $B_{21}B_{11}B_{12} = 0$ .

# $\frac{3}{4}$ -approximation

### Lemma

### Above conditions imply that $\operatorname{rank}(B) \leq \frac{4}{3}r$ .

Thus if no degree 1,2,3 terms then we are done already.
 Otherwise increase the rank by trying O((mn)<sup>3</sup>) choices.

# $\frac{3}{4}$ -approximation

### Lemma

Above conditions imply that  $\operatorname{rank}(B) \leq \frac{4}{3}r$ .

- Thus if no degree 1,2,3 terms then we are done already.
  - Otherwise increase the rank by trying  $O((mn)^3)$  choices.

### Generalizing above ideas

- We have some  $A \in \mathcal{B}$ , with  $\operatorname{rank}(A) = r$ .
- Above discussion hints to the following conjecture.

### Conjecture

For any  $k \leq n$ , either  $\operatorname{rank}(\mathcal{B}) \leq r\left(1 + \frac{1}{k}\right)$  or we can increase the rank by trying  $O((mn)^k)$  choices.

• We prove this conjecture by so called "Wong Sequences".
